What do we expect?

- Rising snowline and earlier snowmelt cause shift in seasonal runoff patterns
- Rising sea level impacts Delta
- Increased evapotranspiration leads to increased demand

Study Assumptions

- Delta regulated by D1641
- CVPIA 3406 (b)(2) and EWA are not included
- 2020 level of development
- Climate change study inflows perturbed to reflect 2050 climate signal
- No changes in operating rules from base to climate change studies

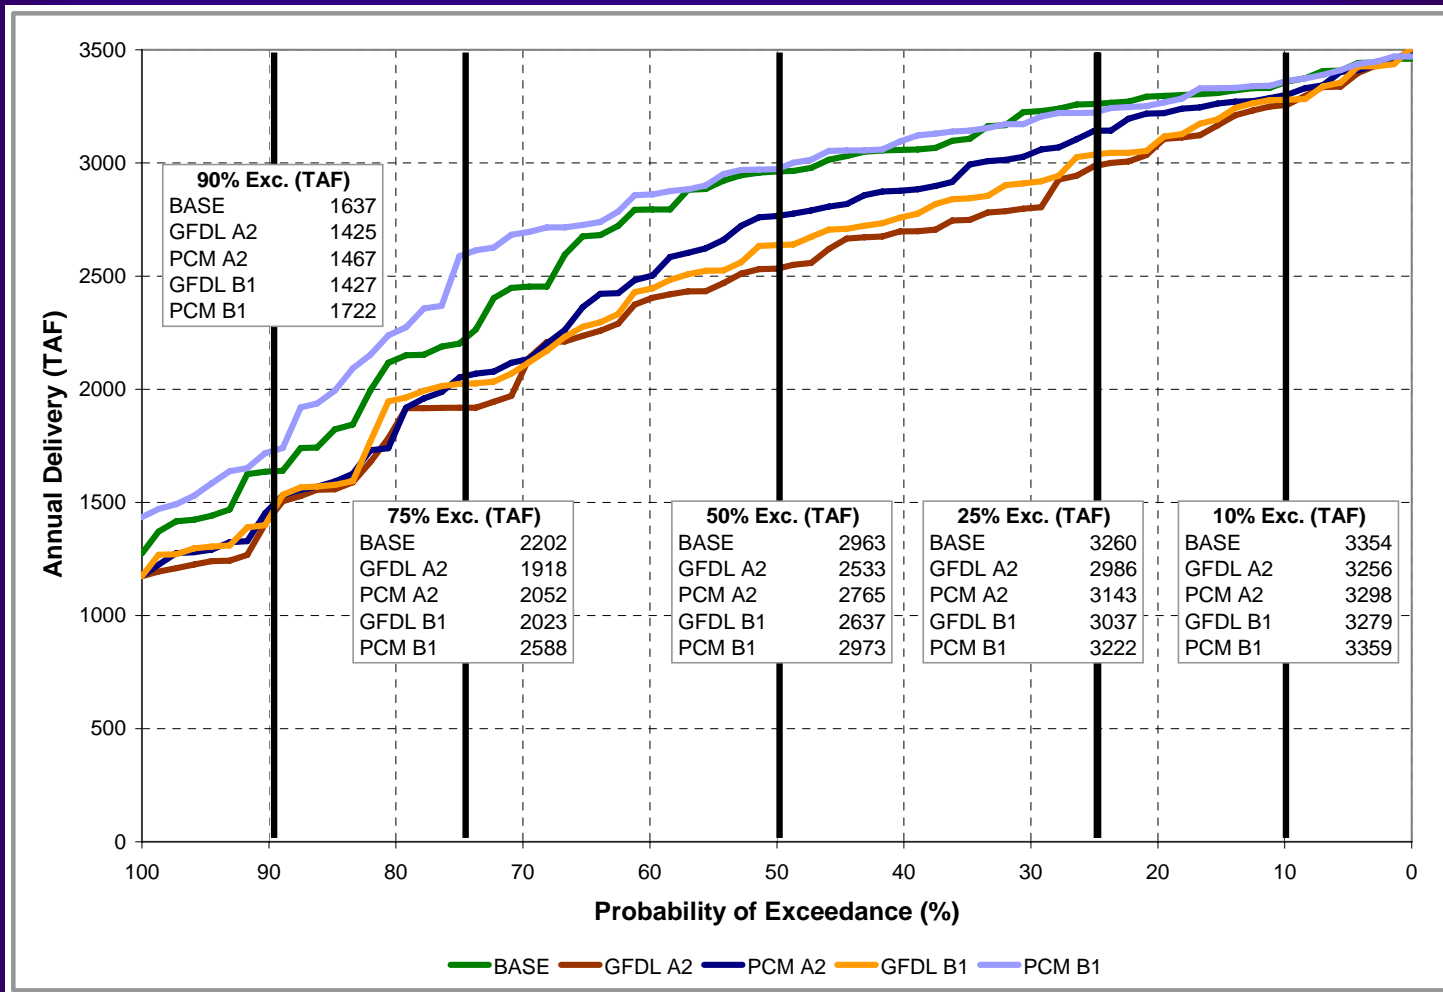

Qualification of Results

- Four climate scenarios with no probability of occurrence.
- Perturbation method accounts for seasonal shift in runoff, not potential changes in weather variability.
- Not accounting for sea level rise or changes in demand.

What else is in Chapter 4?

- Analysis of North-of-Delta and Delta operating constraints and potential for operational flexibility
- CVP/SWP power supply analysis
- Sacramento River temperature analysis

Where do we go from here?

- Perturbation method vs. some other method
- Add climate induced sea level rise and demand changes to CalSim-II analysis
- Search for available operational flexibility to absorb shift in seasonal runoff
